## 1 General information

The product range of Bucher Hydraulics SpA includes single pumps 05-100-212-212HP-250HP-300-312HP (corresponding with the common group denominations: 05-1-2-2.5-3) and several combinations of double pumps, triple pumps, and so on, that can be assembled together according to versions of displacement, flanging, and auxiliary valves .

Bucher Hydraulics SpA has supplied a wide range of external gear pumps and motors to industrial and mobile applications since many years.

Bucher's external gear pumps are widely used in modern hydraulic system to obtain high performances, long life service and low purchase and maintenance costs.

Now, Bucher is introducing a new Gear Pumps family, AP250HP (group 2.5), specifically developed for wheel loaders, excavators and telehandlers applications.

Bucher designed this new pump AP250HP with support bearings mounted in the cast iron body and covers. Tandem and triple pumps are also available with direct connections between the shafts.

AP250HP is the result of a focused design, studied also with the aid of a software internally developed and used for the calculations of the most important mechanical parameters of the gears and to optimize all the performances with a consequent noise and vibration reduction.

Bucher Hydraulics has so achieved this state of the art by constantly improving its design, control and manufacturing techniques aligned with the latest technological developments, while simultaneously enhancing its Quality System ensuring that every single product offers the same high standards.

### Main applications and benefits

- Long life expectancy
- High efficiencies
- Noise & vibration reduction
- Strong interface
- Shaft load reduction
- AP250HP flange interface
- High pressure limits
- Reduced number of components
- Reduced overall dimension
- Direct and stronger connections between shafts (tandem/Triple pumps )

The AP250HP cast iron gear pump mix the best part of AP212 and AP300 frame sizes improving power density due to wide range of displacements from 15 to 54 cm<sup>3</sup>/rev.

## 1.1 External gear pumps components and construction / benefits

- A**  
Cast iron front cover: the standard front-cover design can be fitted to two different pump interfaces.
- B**  
Cast iron main pump body: wide range of displacements obtainable with two different basic bodies. Pump centre-section and back cover integrated in only one body. Rear ports on request.
- C**  
HNBR seal material instead of NBR.
- D**  
Double HNBR shaft seals.

- E**  
Pressure-balance plate manufactured in bronze instead of aluminium. Balancing area and intermediate notches optimised.
- F**  
Large-diameter bearings, fitted both in front cover and body.
- G**  
Large number of teeth, tooth profile optimised, larger shaft diameter.

**BENEFITS**

↓

- A B** Flexibility/smaller number of components
- A B D** Reduced risk of external leakage
- A B E** High efficiencies/pressure limits
- A B E** Long life expectancy
- C D** Wider temperature range
- E G** Lower pressure ripple
- E G** Noise/vibration reduction
- E F G** Higher load capacity and transmissible torque
- E F G** Low friction and high mechanical efficiency
- E F G** Higher max. pressure limit

The front mounting flange and the body/backcover are made of high-strength cast iron to give thermal stability, resistance to contamination and the strength necessary for persistently high levels of performance and life, needed in demanding heavy duty applications. Body/back cover integrated, bigger shaft diameter, bigger bearing dimension and bronze trust plate have been optimized to provide

heavy duty, high pressure limits, high efficiencies and long life expectancy. Noise and vibration reduction due to the high number of teeth. The bearings are located in the front mounting flange, in the body/back cover and, for multiple pumps, in the intermediate cover.

\*\* : The max admitted speed is referred to single pump/single inlet configuration. In case of multiple pumps with common suction line, a speed reduction must be considered.

**IMPORTANT!:** The pressure values are referred to unidirectional pumps, single versions only.

Please consult Bucher Hydraulics if even one of the operating limits indicated in the table (temperature, pressure, rpm) is exceeded, as well as in the case of two or more maximum values at the same time, or for applications with particularly heavy-duty cycles

## 1.3 Pressure

Pressure levels:

P1 = continuous pressure

P3 = peak pressure

The recommended oil speed in the pressure pipes is:

$$v = 2 \text{ to } 5 \text{ m/s}$$

## 1.4 Suction

The absolute suction pressure must be  $P_{in} \geq 0.75 \text{ bar}$  (11 PSI); therefore, the following must be avoided:

- large height differences between pump and tank
- long stretches of piping
- special features such as:
  - bends
  - reductions in diameter
  - quick couplings
  - etc.

## 1.5 General precaution

In addition to the recommendations regarding fluids, filtration, coupling, etc., we suggest the following:

- Always check the rotation direction of the pump's drive shaft; it must be compatible with the rotation direction of the pump itself.
- Be particularly careful in cleaning and make sure, when connecting the suction and pressure piping, that no chips, rag threads, teflon tape, etc. get into the pump circulation system.
- Check the tightness of the suction and pressure fittings, the correct positioning of the O-Ring, and make sure there is no dirt between the flange and the pump body.
- The first pump start-up can be facilitated by manually filling the suction piping and the pump itself with oil. To facilitate air bleeding, start the pump with the circuit not pressurised.

### 1.5.1 Hydraulic fluid

The main function of the fluid used in hydraulic systems is to transfer energy but it performs also other important functions: protect the components from corrosion, lubricate the pump moving parts, remove particles and heat from the system.

In order to ensure proper operation and long life of the system it is important to choose the correct hydraulic fluid with proper additives.

Bucher Hydraulics recommends to use a mineral based oil responding to ISO 6743/4 requirements, only.

It is also advisable to choose a filter of a suitable size to minimise any pressure drop and to take measures to prevent gradual clogging over time.

- To ensure the best heat distribution inside the tank, make sure the return pipe is not too close to the pump's suction piping. The pipings themselves should be below oil tank level to prevent the formation of foam.
- Do not subject the pumps to operating conditions different from those indicated on section 1.2 ; for extreme operations, always contact our Sales Department.
- In the event of pump painting, do not use solvents or paints that are incompatible with the material of the seals. Do not bake paint with excessively high temperatures. Do not paint over the product identification plate.

The system should be operated only with hydraulic oil containing anti-foaming and antioxidant additives. Before using other types of fluid, please contact our Sales Dept, since they can cause serious damage to the directional valve components and jeopardize the correct function of the system.

Never use fluids different from those indicated in section 1.2 and do not use fluids incompatible with the pump seals (i.e. HNBR)

## 1.5.2 Filtration

In order to ensure proper operation and long life of the pump components it is extremely important to provide a proper and effective filtration of the hydraulic fluid.

It is advisable to follow filter manufacturers instruction and recommendations.

The fineness of the filter should be selected in order to guarantee that a contamination levels indicated on section 1.2. When the high reliability of the system is an important requirement, a pressure filter must be used. In these cases it is also advisable to use a pressure filter with by-pass and indicator.

The size of the return filters must suit the maximum return

flow whereas the size of the pressure filters must suit the maximum pump flow.

It is advisable to fit filters with pressure gauge or dirt indicator in order to make it possible to verify the filter condition. Particular attention has to be paid to the cleaning of the machine hydraulic circuit and its components before the first run-in, since the presence of foreign materials could cause damages even if a proper filtration is provided.

In order to obtain the best performance of the system we recommend to strictly follow the conditions advised here above, failing which warranty shall be void.

## 1.5.3 Directives and standards

Atex

Attention: The equipment and protective systems of this catalogue ARE NOT intended for use in potentially explosive atmospheres that is to say where there is an explosive atmosphere. Ref: Directive 99/92/EC and Directive 2014/34/UE.

- ISO 9001: 2008 / ISO 14001:2004

Bucher Hydraulics S.p.A. is certified for research, development and production of directional control valves, gear pumps and motors, power units, electro pumps, cart-ridge valves and integrated manifolds for hydraulic applications.

## 1.6 Identifying the rotation direction

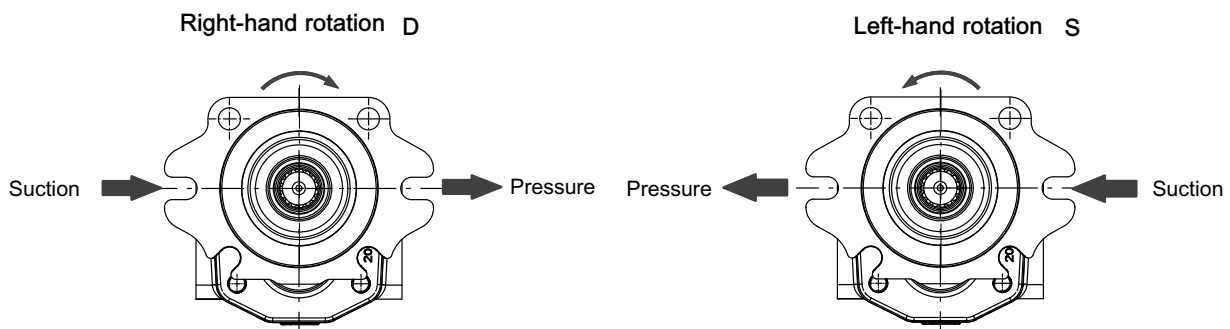

The rotation direction of a gear pump is identified by looking at the pump from the front and with the drive gear turned upwards (see figures below).

Pumps with clockwise rotation (D) have a drive gear which turns clockwise, with the suction port on the left and the pressure port on the right.

Pumps with counterclockwise rotation (S) have a drive gear which turns counterclockwise, with the suction port on the

right and the pressure port on the left. The figure also shows the pressure flow inside the pumps as the oil is transferred from the suction port to the pressure port.

Pumps with a unidirectional rotation (D or S) have the denomination AP.

### 1.7 Formulas to determinate main gear pump operate parameters

The following parameters are defined:

$V_c$  = (cm<sup>3</sup>/rev) pump displacement;

$n$  = (rev/min) no. of rpms of the drive shaft;

$Q$  = (l/min) flow rate;

$p$  = (bar) operating pressure;

$T$  = (Nm) drive torque;

$N$  = (kW) Absorbed power;

$\eta_v$  = (%) volumetric efficiency;

$\eta_m$  = (%) mechanical efficiency;

$\eta_t$  = (%) total efficiency

$$Q = \frac{V_c \cdot n}{100000} \cdot \eta_v \quad T = 1.59 \cdot \frac{p \cdot V_c}{\eta_m} \quad N = \frac{Q \cdot p}{6 \cdot \eta_t}$$

#### Example

AP250HP/15  $V_c = 15.2 \text{ cm}^3/\text{r}$   $n = 1500 \text{ r/min}$   $p = 200 \text{ bar}$   $\eta_v = 94\%$   $\eta_m = 90\%$   $\eta_t = 84.6\%$

$$Q = \frac{15.2 \cdot 1500}{100000} \cdot 94 = 21.43 \text{ l/min.}$$

$$T = 1.59 \cdot \frac{200 \cdot 15.2}{90} = 53.7 \text{ Nm}$$

$$N = \frac{21.43 \cdot 200}{6 \cdot 84.6} = 8.44 \text{ kW}$$

## 2 Overview standard pump configurations

This pumps configuration are considered as "standard".

|          |        |        |        |        |
|----------|--------|--------|--------|--------|
| 13 teeth | S38B2P | S38B2S | S38B8G | S38B8S |
| 15 teeth | S58B2P | S58B2S | S58B8G | S58B8S |

In the next pages, front, body/rear cover, and seals materials are listed for each pump series. For ordering purposes, it is enough to outline the complete pump description (for example: AP250HP/15 S38B2P).

In case of a different configuration request (or a combination of different features, such as port threads, front flange materials, etc.), the description configurator shown in section 3.1 can be easily used.

### 3 AP250HP Single pump customised versions

---

In this section, a single AP250HP pump can be configured and customized.

AP250HP wide availability of covers, bodies and gears provides great flexibility to AP250HP pump range and allows several different pump configurations.

In order to simplify the selection of the desired pump combination, a 'configurator form' is available and, by filling it out, it will guide you in the pump creation process.

**IMPORTANT!:** Tightening torques depends on several different factors including lubrication, coating and surfaces finish. The fitting manufacturer shall be consulted.

In the interest of safety, only fittings with STRAIGHT THREAD ENDS should be used (e.g. DIN3852).

Fittings with TAPERED THREAD ENDS (e.g. DIN 3852 form C) should never be used, as they can cause deformation and cracks in the valve body.

Our warranty conditions will not be valid in case tapered fittings are used.

The work port adaptors have to be fastened respecting the tightening torque values indicated.

## 4 Multiple gear pumps

### 4.1 Multiple gear pumps: AP250HP+AP250HP standard versions

Standard versions means separated inlet/outlet side ports, without shaft seal between pump stages

#### 4.1.1 Drive torque calculation example

Example: AP250HP/36 + AP250HP/36

$$T_{max} = 1.59 \cdot \frac{36 \cdot 200}{90} + 1.59 \cdot \frac{36 \cdot 100}{90} = 127.2 + 63.6 = 190.8 \text{ Nm}$$

$$T_{max} = 190.8 \leq 270 \text{ Nm}$$

(splined 13T)

$$T_2 = 63.6 \leq T_{imax} 200 \text{ Nm}$$

Common suction versions available on request. Please contact our Sales Department.

## 4.2 Multiple gear pumps: AP250HP+AP250HP+AP250HP standard versions

Standard versions means separated inlet/outlet side ports, without shaft seal between pump stages

### 4.2.1 Drive torque calculation example

$$T_{\max} = 1.59 \cdot \frac{p_1 \cdot V_{c1}}{\eta_{m1}} + 1.59 \cdot \frac{p_2 \cdot V_{c2}}{\eta_{m2}} + 1.59 \cdot \frac{p_3 \cdot V_{c3}}{\eta_{m3}}$$

Example: AP250HP/36 + AP250HP/23 + AP250HP/15

$$T_{\max} = 1.59 \cdot \frac{36 \cdot 210}{90} + 1.59 \cdot \frac{23 \cdot 150}{90} + 1.59 \cdot \frac{15 \cdot 120}{90} = 133.6 + 61 + 32 = 226.6 \text{ Nm}$$

$$T_{\max} = 226.6 \leq 270 \text{ Nm (splined 13T)}$$

$$T_2 = 61 \leq T_{\max} 200 \text{ Nm} \quad T_3 = 32 \leq T_{\max} 200 \text{ Nm}$$

## 4.3 Multiple gear pumps: AP250HP+AP212 standard versions

Standard versions means separated inlet/outlet side ports, without shaft seal between pump stages

### 4.3.1 Drive torque calculation example

$$T_{\max} = 1.59 \cdot \frac{p_1 \cdot V_{c1}}{\eta_{m1}} + 1.59 \cdot \frac{p_2 \cdot V_{c2}}{\eta_{m2}}$$

Example: AP250HP/33 + AP212/19

$$T_{\max} = 1.59 \cdot \frac{33 \cdot 200}{90} + 1.59 \cdot \frac{19 \cdot 100}{90} = 116.6 + 33.57 = 150.17 \text{ Nm}$$

$$T_{\max} = 150.17 \leq 270 \text{ Nm (splined 13T)}$$

$$T_2 = 33.57 \leq T_{\max} 200 \text{ Nm}$$

## 4.5 Multiple gear pumps: AP250HP+AP250HP+AP212 standard versions

Standard versions means separated inlet/outlet side ports, without shaft seal between pump stages

### 4.5.1 Drive torque calculation example

$$T_{\max} = 1.59 \cdot \frac{p_1 \cdot V_{c1}}{\eta_{m1}} + 1.59 \cdot \frac{p_2 \cdot V_{c2}}{\eta_{m2}} + 1.59 \cdot \frac{p_3 \cdot V_{c3}}{\eta_{m3}}$$

Example: AP250HP/40 + AP250HP/33 + AP212/6.5

Further information regarding group 2 pumps: see dedicated "AP212 Gear Pumps" catalogue

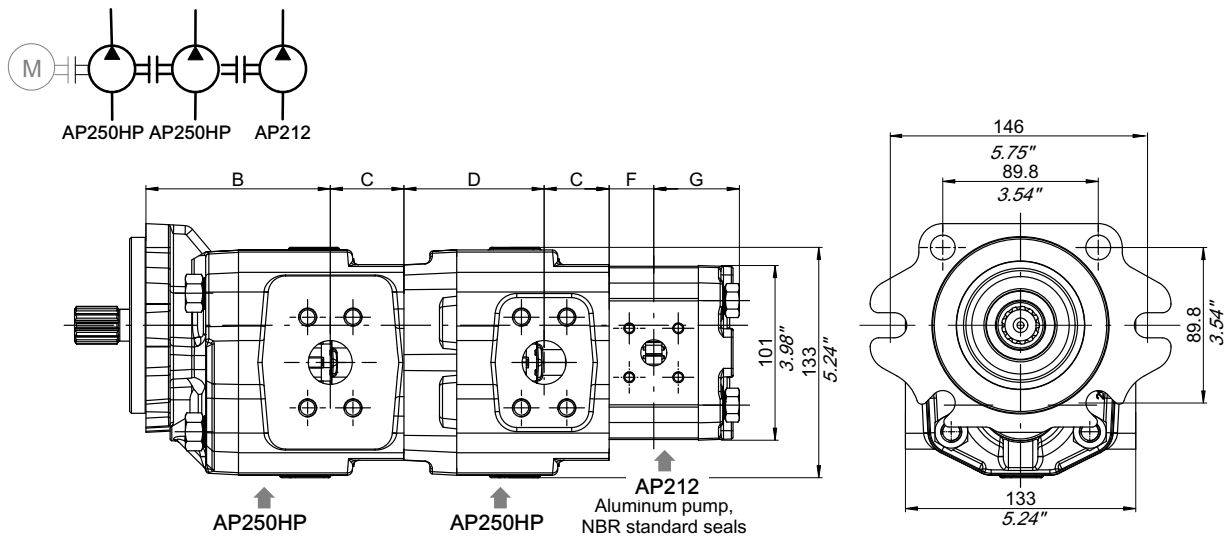

$$T_{\max} = 1.59 \cdot \frac{40 \cdot 210}{90} + 1.59 \cdot \frac{33 \cdot 210}{90} + 1.59 \cdot \frac{6.5 \cdot 120}{90} = 148.4 + 122.43 + 13.78 = 284.61 \text{ Nm}$$

$$T_{\max} = 284.61 \leq 460 \text{ Nm (splined 15T)}$$

$$T_2 = 33.57 \leq T_{\max} 200 \text{ Nm}$$
